Equations with Fractions

Given an equation with a fraction in it, always try to get rid of the fraction first by multiplying both sides by the denominator of the fraction.

If there are 2 fractions, multiply both sides by the common denominator (LCM of both denominators) of both fractions.

Equations with Fractions

Examples: Solve the following

1. $\frac{3k-1}{4} = 8$

$\times 4 \quad \times 4$
 $3k-1 = 32$
 $+1 \quad +1$
 $3k = 33$
 $\div 3 \quad \div 3$
 $k = 11$

2. $\frac{m+2}{4} + \frac{m-3}{2} = \frac{1}{2}$

$\times 4 \quad \times 4$
 $m+2 + 2(m-3) = 2$
 $m+2 + 2m-6 = 2$
 $3m-4 = 2$
 $+4 \quad +4$
 $3m = 6$
 $\div 3 \quad \div 3$
 $m = 2$
